# Social Media Dashboard with Dark/Light Mode

Project Report | HTML, CSS/SCSS, and JavaScript

| | |
|---|---|
| **Project Type** | Beginner front-end web development project |
| **Technologies** | HTML, CSS/SCSS, JavaScript, browser local storage |
| **Description** | A web dashboard for viewing social media statistics with an interactive dark/light theme switch. |

## 1. Abstract

This project is a responsive social media analytics dashboard that presents key metrics such as followers, likes, views, and engagement in clear statistic cards. Users can switch between dark and light themes. JavaScript manages the theme toggle and saves the selected preference in browser local storage.

## 2. Objectives

• Create a clean dashboard layout using HTML.

• Style statistic cards and page layout using CSS or SCSS.

• Use JavaScript to toggle between dark and light themes.

• Save the selected theme in local storage so it remains after refreshing.

• Make the interface responsive on desktop, tablet, and mobile.

## 3. Main Features

• Overview cards for followers, likes, views, or engagement

• Social platform labels and sample account statistics

• Dark/light theme toggle

• Responsive grid layout

• Saved theme preference using local storage

• Optional daily or weekly activity chart

## 4. Project Modules

**Dashboard header:** Displays the page title and theme switch.

**Statistics cards:** Shows sample metrics for social platforms.

**Theme manager:** Uses JavaScript to switch a theme class on the page.

**Local storage:** Remembers the selected theme across browser refreshes.

**Responsive layout:** Uses CSS grid or flexbox and media queries.

## 5. Testing Checklist

• Theme changes when the toggle is clicked.

• Selected theme remains after reloading the page.

• Cards rearrange correctly on narrow screens.

• Text and icons remain readable in both themes.

• Dashboard displays correctly in a modern browser.

## 6. Expected Outcome

A working, responsive dashboard that displays social media metrics and allows users to change and retain their preferred color theme.

## 7. Conclusion

This project gives practical experience with page structure, responsive styling, DOM manipulation, event handling, and browser local storage. Metrics can be replaced with real data as an extension.

Note: This is a project report for a similar dashboard project, not the original video's source code.
